*A sample of dust vacuumed from the Star-Spangled Banner includes clay particles, vegetable matter, synthetic fibers, and lint magnified 300-fold.*

Although in need of a good laundering when it was taken down from the museum entry hall after Hillman's work, the Star-Spangled Banner couldn't simply be dropped off at the dry cleaners. In December 1998, museum employees gingerly laid it flat on a temporary platform for an inspection. The conservation team drew a map of all the holes, tears, and stains on every square inch of the flag.

Conservators found Armistead's signature on the flag, as well as a needle left from its 1914 restoration. A puzzling red chevron on one of the white stripes, Taylor thinks, was an aborted attempt to sew the Armistead family monogram onto the flag. "The surface of the flag is like an archeological dig," he says. "It contains traces of everything that happened to it."

From its years of hanging in the museum, the banner has collected enough dust and grime to make a vacuum cleaner salesman jump for joy. One of Thomassen-Krauss' colleagues says that micrographs of the dust collected from the surface look like "Bourbon Street after Mardi Gras."

The conservators gave the flag a light vacuuming before they wound it onto a big cardboard tube like a giant roll of paper towels. They then moved it upstairs into a new conservation laboratory that doubles as an exhibit.

The lab is a huge, climate-controlled clean room not unlike ones used to make computer chips. A large, adjustable table supports the flag as conservators care for it. A gantry, or rolling bridge, hovering above the table allows up to seven conservators to work, lying flat on their stomachs, just 4 inches from the flag's surface.

The bridge won't deflect or vibrate, says Anthony Maher, a Washington-based project manager from the architectural and engineering firm KCF-SHG, which designed the room. A steady platform helps prevent workers from damaging threads of the flag as they work on stitches and stains.

The amount of illumination in the lab is kept low—as dim as the dawn's early light, one might say. Filters over lightbulbs remove ultraviolet radiation, and light reaches the flag only indirectly after bouncing off the walls. "Light probably causes the most damage over time," says Thomassen-Krauss. Visitors can peer into the lab through a glass wall.

On the basis of what the infrared camera has found, the conservators will choose cleaning fluids for each stain. Workers will drip the fluids through the fabric and remove the fumes and dirt with large "elephant noses," hoses connected to a powerful exhaust system.

The conservators still aren't sure how they will eventually protect and display the newly freshened flag. "Research is ongoing," says Thomassen-Krauss.

The museum might sandwich the banner between two layers of a sheer, meshlike fabric and stitch them together through the flag's holes and tears. Conservators are also thinking about eventually encasing the relic in a sealed chamber filled with an inert gas, such as neon, to prevent oxidation.

Until then, museum visitors can watch the conservators at work. If everything goes according to plan, their treatment will ensure that the Star-Spangled Banner gallantly waves for generations to come. □

*A sample of dust vacuumed from the Star-Spangled Banner includes clay particles, vegetable matter, synthetic fibers, and lint magnified 300-fold.*

Although in need of a good laundering when it was taken down from the museum entry hall after Hillman's work, the Star-Spangled Banner couldn't simply be dropped off at the dry cleaners. In December 1998, museum employees gingerly laid it flat on a temporary platform for an inspection. The conservation team drew a map of all the holes, tears, and stains on every square inch of the flag.

Conservators found Armistead's signature on the flag, as well as a needle left from its 1914 restoration. A puzzling red chevron on one of the white stripes, Taylor thinks, was an aborted attempt to sew the Armistead family monogram onto the flag. "The surface of the flag is like an archeological dig," he says. "It contains traces of everything that happened to it."

From its years of hanging in the museum, the banner has collected enough dust and grime to make a vacuum cleaner salesman jump for joy. One of Thomassen-Krauss' colleagues says that micrographs of the dust collected from the surface look like "Bourbon Street after Mardi Gras."

The conservators gave the flag a light vacuuming before they wound it onto a big cardboard tube like a giant roll of paper towels. They then moved it upstairs into a new conservation laboratory that doubles as an exhibit.

The lab is a huge, climate-controlled clean room not unlike ones used to make computer chips. A large, adjustable table supports the flag as conservators care for it. A gantry, or rolling bridge, hovering above the table allows up to seven conservators to work, lying flat on their stomachs, just 4 inches from the flag's surface.

The bridge won't deflect or vibrate, says Anthony Maher, a Washington-based project manager from the architectural and engineering firm KCF-SHG, which designed the room. A steady platform helps prevent workers from damaging threads of the flag as they work on stitches and stains.

The amount of illumination in the lab is kept low—as dim as the dawn's early light, one might say. Filters over lightbulbs remove ultraviolet radiation, and light reaches the flag only indirectly after bouncing off the walls. "Light probably causes the most damage over time," says Thomassen-Krauss. Visitors can peer into the lab through a glass wall.

On the basis of what the infrared camera has found, the conservators will choose cleaning fluids for each stain. Workers will drip the fluids through the fabric and remove the fumes and dirt with large "elephant noses," hoses connected to a powerful exhaust system.

The conservators still aren't sure how they will eventually protect and display the newly freshened flag. "Research is ongoing," says Thomassen-Krauss.

The museum might sandwich the banner between two layers of a sheer, meshlike fabric and stitch them together through the flag's holes and tears. Conservators are also thinking about eventually encasing the relic in a sealed chamber filled with an inert gas, such as neon, to prevent oxidation.

Until then, museum visitors can watch the conservators at work. If everything goes according to plan, their treatment will ensure that the Star-Spangled Banner gallantly waves for generations to come. □
